## CHM 1220-Dang Chapter 15 - Chemical Equilibrium

Many reactions do not go to completion instead of reaching an equilibrium state

## 15.1- Chemical Equilibrium -The Concept of Dynamic Equilibrium:

- The state reached when the concentrations of reactants and products remain constant over time.
- The rate forward and reverse have become equal
- Chemical equilibrium ( $\rightleftharpoons$ ) is reversible . Reaction occurs in both direction

$$
\mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}_{2}(\mathrm{~g})
$$

(a) Only $\mathrm{N}_{2} \mathrm{O}_{4}$ is present initially.

(b) Only $\mathrm{NO}_{2}$ is present initially.

In both experiments, a state of chemical equilibrium is reached when the concentrations level off at constant values: $\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]=0.0337 \mathrm{M} ;\left[\mathrm{NO}_{2}\right]=0.0125 \mathrm{M}$.

Equilibrium is a dynamic process. The conversions of reactants to products and products to reactants are still going on, although there is no net change in the number of reactant and product molecules.

When the two rates become equal, an equilibrium state is attained and there are no further changes in concentrations.

## 15.2-15.3:The Equilibrium Constant, $K_{c}$ and $K_{p}$

Law of mass action - The value of the equilibrium constant expression, $\mathbf{K}_{\mathbf{c}}$, is constant for a given reaction at equilibrium and at a constant temperature.

- The equilibrium concentrations of reactants and products may vary, but the value for $\mathbf{K}_{\mathrm{c}}$ remains the same.

Other Characteristics of $\mathbf{K}_{\mathbf{c}}$

1) Equilibrium can be approached from either direction.
2) $K_{c}$ does not depend on the initial concentrations of reactants and products.
3) $K_{c}$ does depend on temperature.
4) $K_{c}$ value is written without units

Because the molarity of each substance is divided by its molarity ( 1 M ) in thermodynamic sate

For a reaction $\mathbf{a A}+\mathbf{b B} \rightleftharpoons \mathbf{c C}+\mathbf{d D}$
The equilibrium constant, $\mathbf{K}_{\mathbf{c}}$, is the ratio of the equilibrium concentrations of products over the equilibrium concentrations of reactants each raised to the power of their stoichiometric coefficients

Equilibrium constant

$\boldsymbol{K}_{\mathrm{c}}=\underbrace{[\mathrm{C}][\mathrm{D}]}_{\underbrace{[\mathrm{A}]^{a}[\mathrm{~B}]^{b} \longleftarrow}}$ Coefficients
Equilibrium constant expression when concentrations are used

Table 15.1 Concentration Data at $25^{\circ} \mathrm{Celsius}$ for the Reaction

|  | Initial <br> Concentrations <br> $(M)$ | Initial <br> Concentrations <br> $(M)$ | Equilibrium <br> Concentrations <br> $(M)$ | Equilibrium <br> Concentrations <br> $(M)$ | Equilibrium <br> Constant <br> Expression |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Experiment | $\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]$ | $\left[\mathrm{NO}_{2}\right]$ | $\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]$ | $\left[\mathrm{NO}_{2}\right]$ | $\left[\mathrm{NO}_{2}\right]^{2} /\left[\mathrm{N}_{2} \mathrm{O}_{4}\right]$ |
| 1 | 0.0400 | 0.0000 | 0.0337 | 0.0125 | $4.64 \times 10^{-3}$ |
| 2 | 0.0000 | 0.0800 | 0.0337 | 0.0125 | $4.64 \times 10^{-3}$ |

Experiment 1
Experiment 5

## Writing Equilibrium Expression

- Simply write the chemical formula products over the chemical formula of the reactants
- For homogenous equilibrium
- Reactants and products are in the same phases
- E.g $\mathrm{CH}_{4}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightleftharpoons \mathrm{CO}(\mathrm{g})+3 \mathrm{H}_{2}(\mathrm{~g})$

$$
\mathrm{K}_{\mathrm{c}}=\frac{|\mathrm{CO}|\left[\mathrm{H}_{2}\right]^{3}}{\left[\mathrm{CH}_{4}\right] \mid\left[\mathrm{H}_{2} \mathrm{O} \mid\right.}
$$

The equilibrium constant and the equilibrium constant expression are for the chemical equation as written.

$$
\begin{aligned}
& \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NH}_{3}(\mathrm{~g}) \quad \mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{NH}_{3}\right]^{2}}{\left[\mathrm{~N}_{2}\right]\left[\mathrm{H}_{2}\right]^{3}} \\
& 2 \mathrm{NH}_{3}(\mathrm{~g}) \rightarrow \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g})
\end{aligned} \mathrm{K}_{\mathrm{c}}^{\prime}=\frac{\left[\mathrm{N}_{2}\right]\left[\mathrm{H}_{2}\right]^{3}}{\left[\mathrm{NH}_{3}\right]^{2}}=\frac{1}{\mathrm{~K}_{\mathrm{c}}}, ~\left(\mathrm{~K}{ }_{\mathrm{c}}^{\prime \prime}=\frac{\left[\mathrm{NH}_{3}\right]^{4}}{\left[\mathrm{~N}_{2}\right]^{2}\left[\mathrm{H}_{2}\right]^{6}}=\mathrm{Kc}^{2} .\right.
$$

When you add equations to get a new equation, the equilibrium constant of the new equation is the product of the equilibrium constants of the old equations.
$A \rightleftharpoons 2 B$
$2 B \rightleftharpoons 3 \mathrm{C}$
$\mathrm{A} \rightleftharpoons 3 \mathrm{C}$
$\mathrm{K}_{1}=\frac{[\mathrm{B}]^{2}}{[\mathrm{~A}]}$
Determine $\mathrm{K}_{\text {overall }}$
$\mathrm{K}_{\text {overall }}=\mathrm{K}_{1} \times \mathrm{K}_{2}$

## The Equilibrium Constant $\boldsymbol{K}_{\mathrm{p}}$

- When writing an equilibrium expression for a gaseous reaction in terms of partially pressure, we call it equilibrium constant, $\mathrm{K}_{\mathrm{p}}$

$$
\mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}_{2}(\mathrm{~g})
$$

$K_{p}=\frac{\left(P_{\mathrm{NO} 2}\right)^{2}}{\mathbf{P}_{\mathrm{N} 2 \mathrm{O} 4}}$

$$
\mathrm{K}_{\mathrm{c}}=? ? ?
$$

- Reactants and products are in different phases
E.g $\mathrm{CaCO}_{3}(\mathrm{~s}) \rightleftharpoons \mathrm{CaO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g}) \quad \mathbf{K}_{\mathrm{c}}=\left[\mathrm{CO}_{2}\right]$
pure solids and liquids: concentrations of pure solids and liquids are fixed by their density and molar mass (both constants) and do not vary with the amount. They are not included when writing an equilibrium equation.
 manometer) is the same in (a) and (b), independent of how much solid $\mathrm{CaCO}_{3}$ and CaO is present.

## Concentration $=\mathbf{M}=\frac{\text { Density }}{\text { Molar Mass }}$

### 15.5 Using the Equilibrium Constant

Knowing the value of the equilibrium constant for a chemical reaction lets us judge the extent of the reaction, predict the direction of the reaction, and calculate equilibrium concentrations from initial concentrations.

The larger the value of the equilibrium constant $K_{\mathrm{c}}$, the greater the extent of reaction:

Reaction proceeds
hardly at all.

Appreciable concentrations of both reactants and products are present at equilibrium.

Reaction proceeds nearly to completion.

$$
K=\frac{[\mathrm{HBr}]^{2}}{\left[\mathrm{H}_{2}\right]\left[\mathrm{Br}_{2}\right]}=\text { large number }
$$

When the value of $K_{e q} \gg 10^{3}$, when the reaction reaches equilibrium there will be many more product molecules present than reactant molecules.
The position of equilibrium favors products

When the value of $K_{e q} \ll 10^{-3}$, when the reaction reaches equilibrium there will be many more reactant molecules present than product molecules.
The position of equilibrium favors reactants.

Example: When wine spoils, ethanol is oxidized to acetic acid as $\mathrm{O}_{2}$ from the air reacts with the wine:

$$
\begin{gathered}
\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{aq})+\mathrm{O}_{2}(\mathrm{aq}) \underset{\text { Ethanol }}{\rightleftharpoons \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}(\mathrm{aq})}+\underset{2}{\mathrm{H}_{2} \mathrm{O}(\mathrm{l})} \\
\text { Acetic acid }
\end{gathered}
$$

The value of $\mathrm{K}_{\mathrm{c}}$ for this reaction at $25^{\circ} \mathrm{C}$ is $1.2 \times 10^{82}$. What are the relative amounts of ethanol and acetic acid once the reaction has reached equilibrium?
A. The concentration of ethanol will be significantly greater than the concentration of acetic acid.
B. The concentration of ethanol will be nearly the same as the concentration of acetic acid.
C. The concentration of ethanol will be slightly less than the concentration of acetic acid.
D. The concentration of ethanol will be extremely small and much less than the concentration of acetic acid.

## Relating the Equilibrium Constant $K_{\mathrm{p}}$ and $\mathbf{K}_{\mathrm{c}}$

The constant $\mathrm{K}_{\mathrm{c}}$ an $\mathrm{K}_{\mathrm{p}}$ are related because the pressure of each component in a mixture of ideal gases directly proportional to its molar concentration.

$$
\mathrm{aA}+\mathrm{bB} \rightleftharpoons \mathrm{cC}+\mathrm{dD}
$$

For component A

$$
\mathrm{P}_{\mathrm{A}} \mathrm{~V}=\mathrm{n}_{\mathrm{A}} \mathrm{RT} \text { (Ideal Gas Law) }
$$

$$
\mathrm{P}_{\mathrm{A}}=\frac{\mathrm{n}_{\mathrm{A}}}{\mathrm{~V}} \mathrm{RT}=[\mathrm{A}] \mathrm{RT}
$$

Similarly, $P_{B}=[B] R T, P_{C}=[C] R T$, and $P_{D}=[D] R T$. The equilibrium equation for $K_{P}$ is therefore given by

$$
\begin{gathered}
\mathrm{K}_{\mathrm{p}}=\frac{\left(\mathrm{P}_{\mathrm{C}}\right)^{\mathrm{c}}\left(\mathrm{P}_{\mathrm{D}}\right)^{\mathrm{d}}}{\left(\mathrm{P}_{\mathrm{A}}\right) \mathrm{a}\left(\mathrm{P}_{\mathrm{B}}\right)^{\mathrm{b}}}=\frac{([\mathrm{C}] \mathrm{RT})^{\mathrm{c}}([\mathrm{D}] \mathrm{RT})^{\mathrm{d}}}{([\mathrm{~A}] \mathrm{RT})^{\mathrm{a}}([\mathrm{~B}] \mathrm{RT})^{\mathrm{b}}}=\frac{[\mathrm{C}]^{\mathrm{c}}[\mathrm{D}]^{\mathrm{d}}}{[\mathrm{~A}]^{\mathrm{c}}[\mathrm{~B}]^{\mathrm{d}}} \mathrm{x}(\mathrm{RT})^{(\mathrm{c}+\mathrm{d})-(\mathrm{a}+\mathrm{b})} \\
\boldsymbol{K}_{\mathrm{p}}=\boldsymbol{K}_{\mathrm{c}}(\boldsymbol{R} \boldsymbol{T})^{\Delta n}
\end{gathered}
$$

$\mathrm{R}=$ gas constant $(0.08206 \mathrm{~L} \cdot \mathrm{~atm} / \mathrm{K} \cdot \mathrm{mol})$
$\mathrm{T}=$ Temperature (in K )
$\Delta \mathrm{n}=$ is the number of moles of gaseous products minus the number of moles of gaseous reactants.

## Dang5

Example: For the reaction, $2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{SO}_{3}(\mathrm{~g})$
(a) write the equilibrium constant expression, $\mathrm{K}_{\mathrm{p}}$ and $\mathrm{K}_{\mathrm{p}}$ ?
(b) What is the value for $\mathrm{K}_{\mathrm{p}}$ if $\mathrm{K}_{\mathrm{c}}=2.8 \times 10^{2}$ at 1000 K ?
(c) What is the value of $\mathrm{K}_{\mathrm{c}}$ ?

## Predicting the Direction of Reaction from initial concentrations

- For a chemical system whether in equilibrium or not, we can calculate the value given by the law of mass action. We called it reaction quotient, $\mathbf{Q}_{\mathbf{c}}$
- The reaction quotient, $\mathrm{Q}_{\mathrm{c}}$, is defined in the same way as the equilibrium constant, $\mathrm{K}_{\mathrm{c}}$, except that the concentrations in $\mathrm{Q}_{\mathrm{c}}$ are not necessarily equilibrium values

$$
\mathrm{aA}+\mathrm{bB} \rightleftharpoons \mathrm{cC}+\mathrm{dD}
$$

If $\mathbf{Q}>\mathbf{K}$, the reaction will go to the left.

$$
[\mathrm{C}]_{\mathrm{i}}^{\mathrm{c}}[\mathrm{D}]_{\mathrm{i}}^{\mathrm{d}}
$$

$$
Q_{c}=
$$

$$
[\mathrm{A}]_{i}^{a}[\mathrm{~B}]_{i}
$$

- The ratio of products over reactants is too large \& the reaction will move toward equilibrium by forming more reactants.
If $\mathbf{Q}<\mathbf{K}$, the reaction will go to the right.
- The ratio of products over reactants is too small \& the reaction will move toward equilibrium by forming more products.
If $\mathbf{Q}=\mathbf{K}$, the reaction mixture is already at equilibrium, so no shift occurs.

Movement toward equilibrium changes the value of
$\boldsymbol{Q}_{\mathrm{c}}$ until it equals $\boldsymbol{K}_{\mathrm{c}}$, but the value of $\boldsymbol{K}_{\mathrm{c}}$ remains constant.

Example: For the reaction, $\mathrm{B} \rightleftharpoons 2 \mathrm{~A}, \mathrm{~K}_{\mathrm{c}}=2.0$. Suppose 3.0 moles of A and 3.0 moles of B are introduced into a 2.00 L flask. (a) In which direction will the reaction proceed to attain equilibrium?
(b) Will the concentration of B increase, decrease or remain the same as the system moves towards equilibrium?

## Calculating the Equilibrium Constant from Measured Equilibrium Concentrations

a. Using the balanced equation as a guide
b. Prepare an ICE table (what is an ICE table?)

- (I) - The initial concentrations
- (C) - The change in concentration on going to equilibrium, defined as $x$
- (E) - The equilibrium concentration
c. For the reactant or product whose concentration is known both initially and at equilibrium
d. Calculate the change in concentration that occurs
e. Complete the table by sum each column for each reactant and product then determine the concentrations for all at equilibrium
f. Write the equilibrium constant expression then substitute all the values from the table to calculate $\mathbf{K}_{\mathrm{c}}$ or $\mathbf{K}_{\mathbf{p}}$

Example: Consider the following reaction:
A reaction mixture at $780^{\circ} \mathrm{C}$ initially contains $[\mathrm{CO}]=0.500 \mathrm{M}$ and $\left[\mathrm{H}_{2}\right]=1.00 \mathrm{M}$. At equilibrium, $[\mathrm{CO}]$ is found to be 0.150 M . What is the value of $\mathrm{K}_{\mathrm{c}}$ ?
$\mathrm{CO}(\mathrm{g})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{OH}(\mathrm{g})$

## Finding Equilibrium concentrations from Initial Concentrations

- Steps to follow in calculating equilibrium concentrations from initial concentration
- Write a balance equation for the reaction
- Make an ICE (Initial, Change, Equilibrium) table
- Substitute the equilibrium concentrations into the equilibrium equation for the reaction and solve for x
- Calculate the equilibrium concentrations form the calculated value of $x$
- Check your answers

## Calculating Equilibrium Concentrations

- Sometimes you must use quadratic equation to solve for x , choose the mathematical solution that makes chemical sense

Quadratic equation

$$
\begin{gathered}
a x^{2}+b x+c=0 \\
x=\frac{-b \pm \sqrt{b^{2}-4 a c}}{2 a}
\end{gathered}
$$

## For homogeneous equilibrium

|  | $\mathrm{aA}(\mathrm{g})$ | $\mathrm{bB}(\mathrm{g})$ | $\mathrm{cC}(\mathrm{g})$ |
| :---: | :---: | :---: | :---: |
| Initial concentration (M) | $[\mathrm{A}]_{\text {initial }}$ | $[B]_{\text {initial }}$ | $[C] ~$ initial |
| Change in concentration(unknown M ) | - ax | + bx | + cx |
| Equilibrium | $[\mathrm{A}]_{\text {initial }}-\mathrm{ax}$ | $[B]_{\text {initial }}+\mathrm{bx}$ | $[C]_{\text {initial }}+\mathrm{cx}$ |

## For heterogeneous equilibrium

|  | $\mathrm{aA}(\mathrm{g})$ | $\mathrm{bB}(\mathrm{g})$ | $+$ | $\mathrm{cC}(\mathrm{s})$ |
| :---: | :---: | :---: | :---: | :---: |
| Initial concentration (M) | [A] $]_{\text {initial }}$ | $[B]_{\text {initial }}$ |  | N/A |
| Change in concentration(unknown M ) | - ax | + bx |  | N/A |
| Equilibrium | $[\mathrm{A}]_{\text {initial }}-\mathrm{ax}$ | $[B]_{\text {inital }}+\mathrm{bx}$ |  | N/A |

Example: At $700 \mathrm{~K}, 0.500 \mathrm{~mol}$ of $\mathrm{H}_{2}$ and $\mathrm{I}_{2}$ is added to a 2.00 L container and allowed to come to equilibrium.
Calculate the equilibrium concentrations of $\mathrm{H}_{2}, \mathrm{I}_{2}$, and $\mathrm{HI} . \mathrm{K}_{\mathrm{c}}$ is 57.0 at 700 K .

$$
\mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{HI}(\mathrm{~g})
$$

Example: Under certain conditions, the equilibrium constant $\mathrm{K}_{\mathrm{c}}$ for the decomposition of $\mathrm{PCl}_{5}(\mathrm{~g})$ into $\mathrm{PCl}_{3}(\mathrm{~g})$ and $\mathrm{Cl}_{2}(\mathrm{~g})$ is 0.0211 . What are the equilibrium concentrations of $\mathrm{PCl}_{5}, \mathrm{PCl}_{3}$, and $\mathrm{Cl}_{2}$ in a mixture that initially contained only $\mathrm{PCl}_{5}$ at a concentration of 1.00 M ?

$$
\mathrm{PCl}_{5}(\mathrm{~g}) \rightleftharpoons \mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})
$$

## Approximate Solution (The 5\% error rule)

Example: What are the concentrations at equilibrium of a 0.15 M solution of HCN?
$\mathrm{HCN}(\mathrm{aq}) \rightleftharpoons \mathrm{H}+(\mathrm{aq})+\mathrm{CN}^{-}(\mathrm{aq}) \quad \mathrm{Kc}=4.9 \times 10^{-10}$

Example: The equilibrium constant for the reaction is 2.44 at 1000 K . What are the equilibrium partial pressures of , CO , and if the initial partial pressures are $\mathrm{P}_{\mathrm{H} 2 \mathrm{O}}=1.20 \mathrm{~atm}, \mathrm{P}_{\mathrm{CO}}=1.00 \mathrm{~atm}$, and $\mathrm{P}_{\mathrm{H} 2}=1.40$ ?

$$
\mathrm{C}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \rightleftharpoons \mathrm{CO}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g})
$$
